

Paystack Payments for Magento 2

Installation Guide

Version: 3.0.10

Requirements

- Magento Open Source or Adobe Commerce 2.4.x
- PHP 8.2 or later
- A [Paystack account](#)
- Command-line access to your Magento installation

Before You Begin

Collect your API keys from the Paystack dashboard under **Settings > API Keys & Webhooks**. You will need both a public key and a secret key. Paystack issues two pairs — one for test mode and one for live mode — and you can install the extension with either.

Take a backup of your Magento installation and database before installing on a production store.

Install with Composer

This is the recommended method. From your Magento root folder:

```
composer require pstk/paystack-magento2-module
php bin/magento module:enable Pstk_Paystack
php bin/magento setup:upgrade
php bin/magento setup:di:compile
php bin/magento cache:flush
```

If your store runs in production mode, redeploy static content afterwards:

```
php bin/magento setup:static-content:deploy -f
```

Install Manually

Use this method if you downloaded the extension package rather than installing from a repository.

1. Extract the package into `app/code/Pstk/Paystack/` in your Magento installation. The folder should contain `registration.php` at its top level.
2. From your Magento root folder, run:

```
php bin/magento module:enable Pstk_Paystack
php bin/magento setup:upgrade
php bin/magento setup:di:compile
php bin/magento cache:flush
```

In production mode, redeploy static content as shown above.

Verify the Installation

Confirm the module is registered and enabled:

```
php bin/magento module:status Pstk_Paystack
```

The command should report the module as enabled. You can also check **Stores > Configuration > Sales > Payment Methods** in the Magento Admin, where a **Paystack** section should now appear.

The extension is installed but not yet active. It will not appear at checkout until you enable and configure it — see the User Guide.

Upgrade

```
composer update pstk/paystack-magento2-module
php bin/magento setup:upgrade
php bin/magento setup:di:compile
php bin/magento cache:flush
```

For a manual installation, replace the contents of `app/code/Pstk/Paystack/` with the new version and run the same commands. Your configuration is stored in the Magento database and is preserved across upgrades.

Uninstall

Disable the module and clear the generated code:

```
php bin/magento module:disable Pstk_Paystack
php bin/magento setup:upgrade
php bin/magento cache:flush
```

For a Composer installation, remove the package with `composer remove pstk/paystack-magento2-module`. For a manual installation, delete `app/code/Pstk/Paystack/`.

Disabling the module leaves its stored configuration in place, so re-enabling later restores your settings.

Installation Troubleshooting

The module does not appear in `module:status`. Confirm the files are at `app/code/Pstk/Paystack/` and that `registration.php` sits at the top of that folder, then re-run `php bin/magento setup:upgrade`.

`setup:di:compile` fails. Remove the generated code and compile again:

```
rm -rf generated/code generated/metadata
php bin/magento setup:di:compile
```

The Paystack section is missing from the Admin. Flush the cache with `php bin/magento cache:flush`, then reload the configuration page. If you are running in production mode, redeploy static content.

Changes do not take effect. Magento caches configuration aggressively. Run `php bin/magento cache:flush` after any change made outside the Admin.

Next Steps

With installation complete, see the **User Guide** to enable the extension, add your API keys, choose an integration type, and set up webhooks.

Support
